

# 1720 - Forward Secrecy: How to Secure SSL from Attacks by Government Agencies

**Dave Corbett**

Technical Product Manager

# Agenda

## Part 1: Introduction

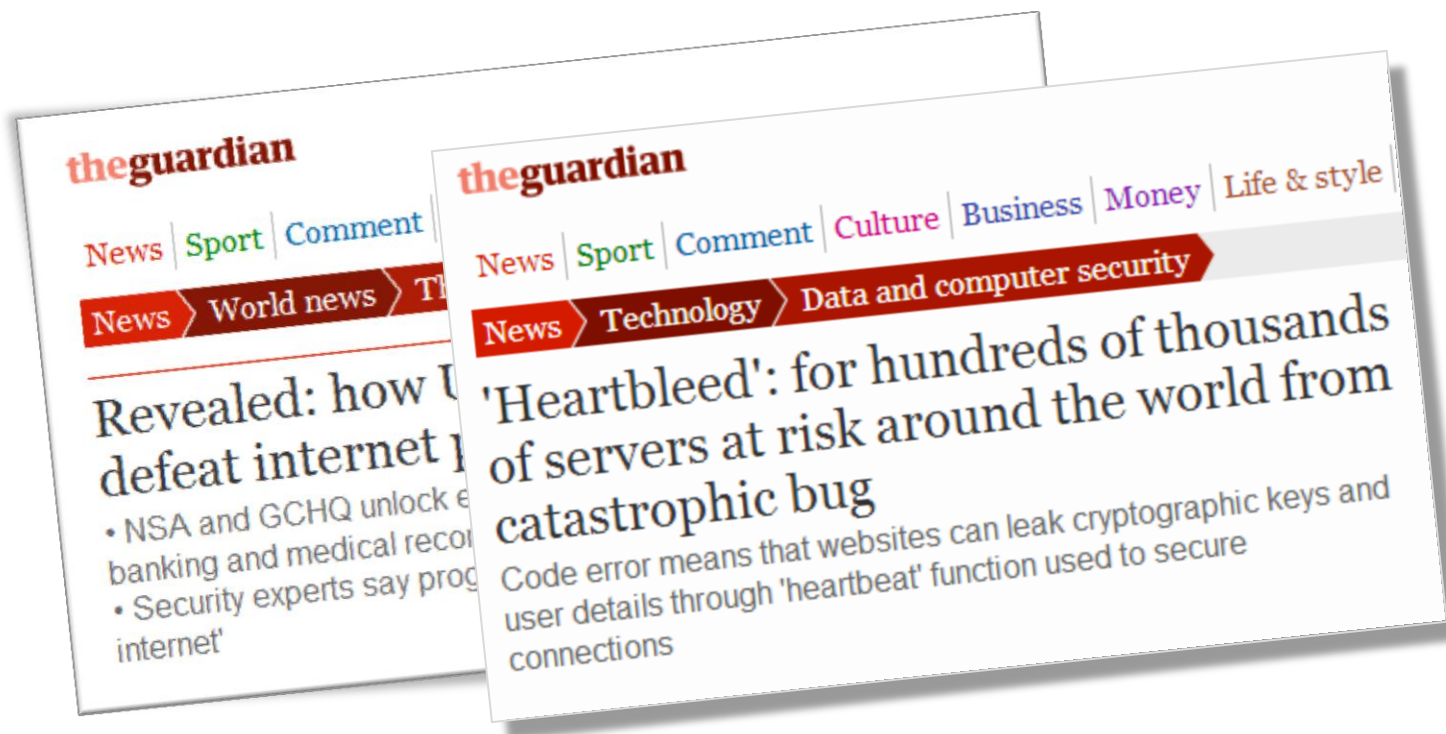

- Why is Forward Secrecy important?
- Technology Overview
  - RSA Algorithm
  - Diffie-Hellman
- Performance Impact
- Increasing adoption of Forward Secrecy

## Part 2: Deep Dive

- RSA Algorithm
- Diffie-Hellman
- Elliptic Curve Cryptography (ECC)
- Implementing Forward Secrecy

# What's the problem?

<http://www.theguardian.com/world/2013/sep/05/nsa-gchq-encryption-codes-security>  
<http://www.theguardian.com/technology/2014/apr/08/heartbleed-bug-puts-encryption-at-risk-for-hundreds-of-thousands-of-servers>

# Why is Forward Secrecy important?

- Using typical HTTPS implementations based on RSA, an adversary could record encrypted data and decrypt it later if they gain access to the relevant private key(s)
- Using Forward Secrecy this approach is impossible

The screenshot shows a blog post on the Computerworld website. The header includes the site name 'COMPUTERWORLD' and navigation links for 'White Papers', 'Webcasts', and 'Newsletters'. Below this is a menu with 'Topics', 'News', 'In Depth', 'Reviews', 'Blogs', and 'Opinion'. The main content area features a profile for Michael Horowitz, author of 'Defensive Computing', with links to 'Read Bio' and 'See Posts'. Social media links for 'Subscribe' and 'Follow @defensivecomput' are also present. The article title is 'Perfect Forward Secrecy can block the NSA from secure web pages, but no one uses it', written by Michael Horowitz on June 21, 2013, with 29 comments.

# Review of SSL/TLS

| <b>FUNCTION</b>               | <b>Examples</b>               |
|-------------------------------|-------------------------------|
| <b>Authentication</b>         | <b>RSA<br/>DSA</b>            |
| <b>Key Exchange/Agreement</b> | <b>RSA<br/>Diffie-Hellman</b> |
| <b>Encryption Algorithm</b>   | <b>RC4<br/>AES</b>            |
| <b>Hashing Algorithm</b>      | <b>MD5<br/>SHA-1</b>          |

# RSA is the problem...

Ron Rivest, Adi Shamir, and Len Adleman released the Rivest-Shamir-Adleman (RSA) public key algorithm in 1978.

This algorithm can be used for encrypting and signing data.

The encryption and signing processes are performed through a series of modular multiplications.

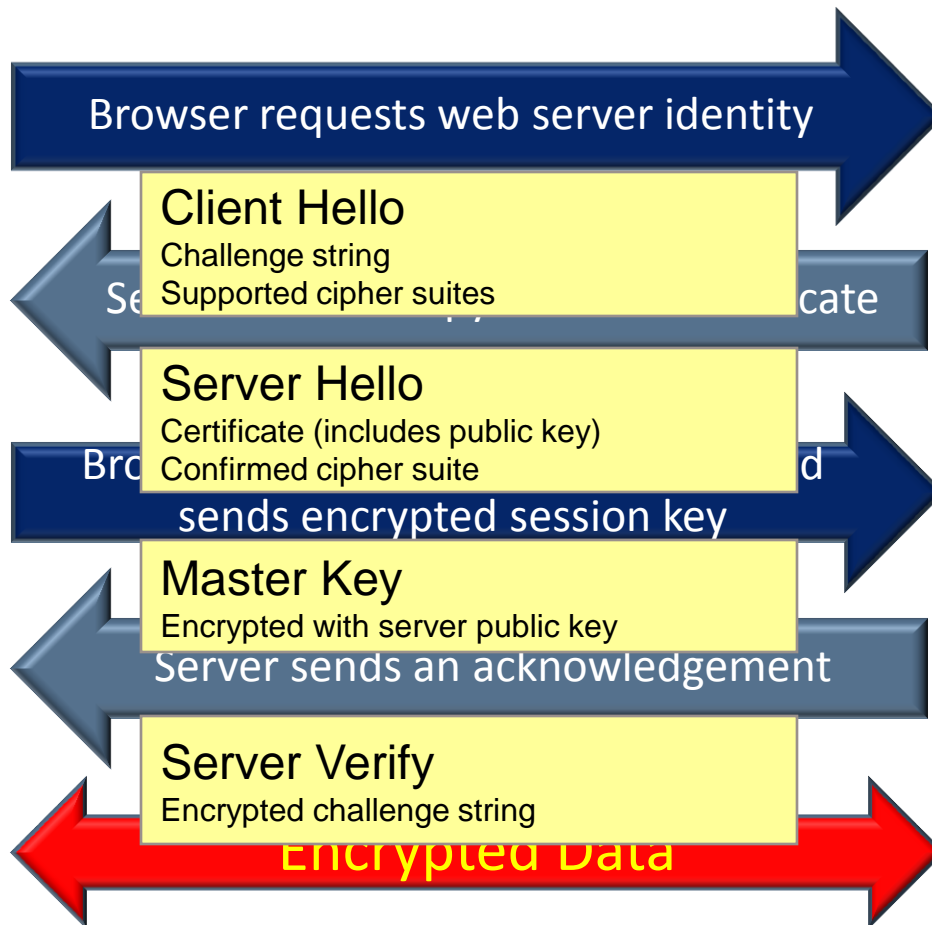

## A Method for Obtaining Digital Signatures and Public-Key Cryptosystems

R.L. Rivest, A. Shamir, and L. Adleman\*

# SSL Handshake Process

## RSA

# RSA key exchange

- During the SSL handshake, the client receives the server's **certificate**
- This includes the server's **public key**
- Using **RSA**, the HTTPS **session key** is encrypted by the client using the server's **public key** and sent to the server across the network
- The server decrypts the session key using the corresponding **private key**

**RSA is vulnerable if the private key is discovered**

## ...Diffie-Hellman is the Solution

The Diffie-Hellman algorithm was invented in 1976 by Whitfield Diffie and Martin Hellman (US patent 4,200,770).

The Diffie-Hellman algorithm is not for encryption or decryption but it enables two parties who are involved in communication to generate a shared secret key for exchanging information confidentially.

**They can do this even when an eavesdropper listens in on their entire conversation.**

**Whitfield 'Whit'  
Diffie**

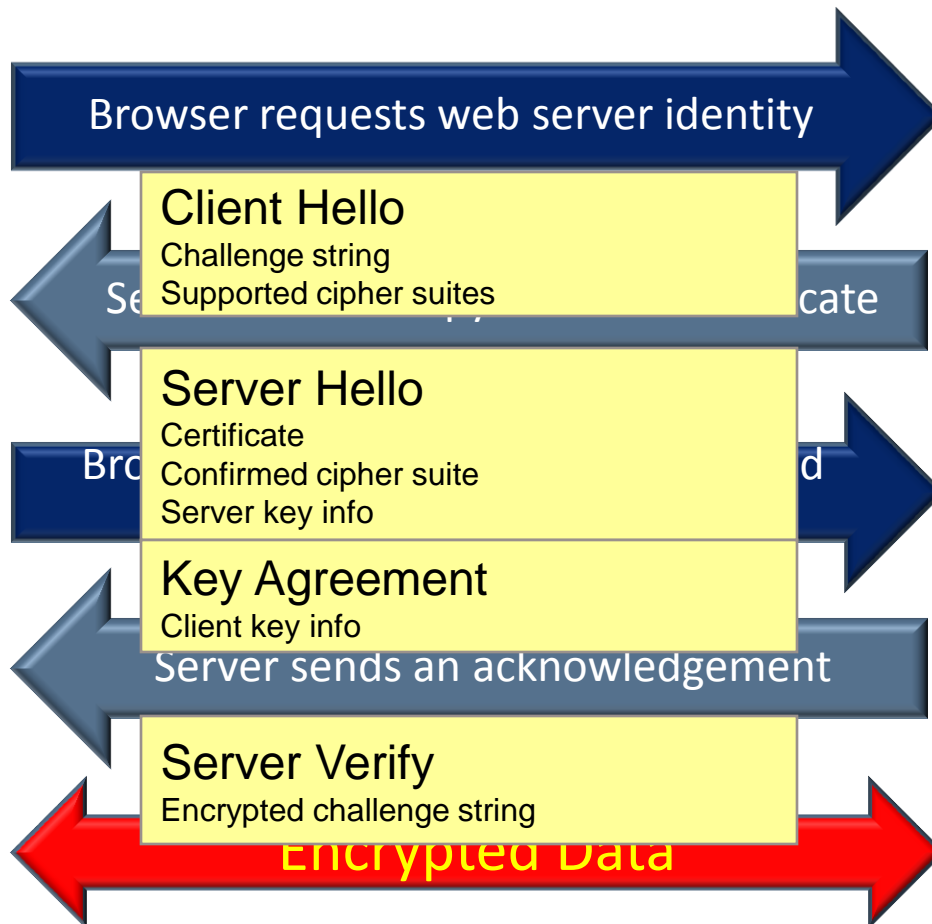

**Martin Hellman**

# SSL Handshake Process

## Diffie-Hellman

## Diffie-Hellman key agreement

- Using **Diffie-Hellman** key agreement, client and server agree a session key without ever sending the key across the network

**Diffie-Hellman can be used to enable Forward Secrecy**

# What is Perfect Forward Secrecy?

- **Forward Secrecy** uses Diffie-Hellman to generate a key for each session
- **Perfect Forward Secrecy** enhances Forward Secrecy by continuously changing the key material during each session
  - generating a new key for each message of a conversation

# Where is Forward Secrecy Implemented?

- As of January 2014, 5% of TLS-enabled websites are configured to use cipher suites that provide forward secrecy to web browsers\*

## Twitter Enables Perfect Forward Secrecy A

# Implementing Forward Secrecy

## SECURITY

### A simple SSL tweak could protect you from GCHQ/NSA snooping

**It might slow you down, but hey, you can't have everything**

By John Leyden, 26th June 2013 [Follow](#) 2,374 followers

73

Protecting your virtual environment

An obscure feature of SSL/TLS called Forward Secrecy may offer greater privacy, according to security experts who have begun promoting the technology in the wake of revelations about mass surveillance by the NSA and GCHQ.

#### RELATED STORIES

# How do you implement Forward Secrecy?

- Diffie-Hellman Key Exchange (DHE) has a significant CPU overhead compared to RSA
- Elliptic Curve Diffie-Hellman (ECDHE) has minimal CPU overhead compared to RSA

Source: Bernat

# Elliptic Curve Cryptography Overview

ECC

1

## Stronger Encryption

- Shorter key than RSA
- 256-bit ECC = 3072-bit RSA
- 10k times harder to crack than RSA 2048
- Meets NIST recommendations

2

## Efficient Performance

- Efficiency increases with higher server loads
- Utilizes less server CPU
- PC's: Faster page load time
- Ideal for mobile devices

3

## Highly Scalable

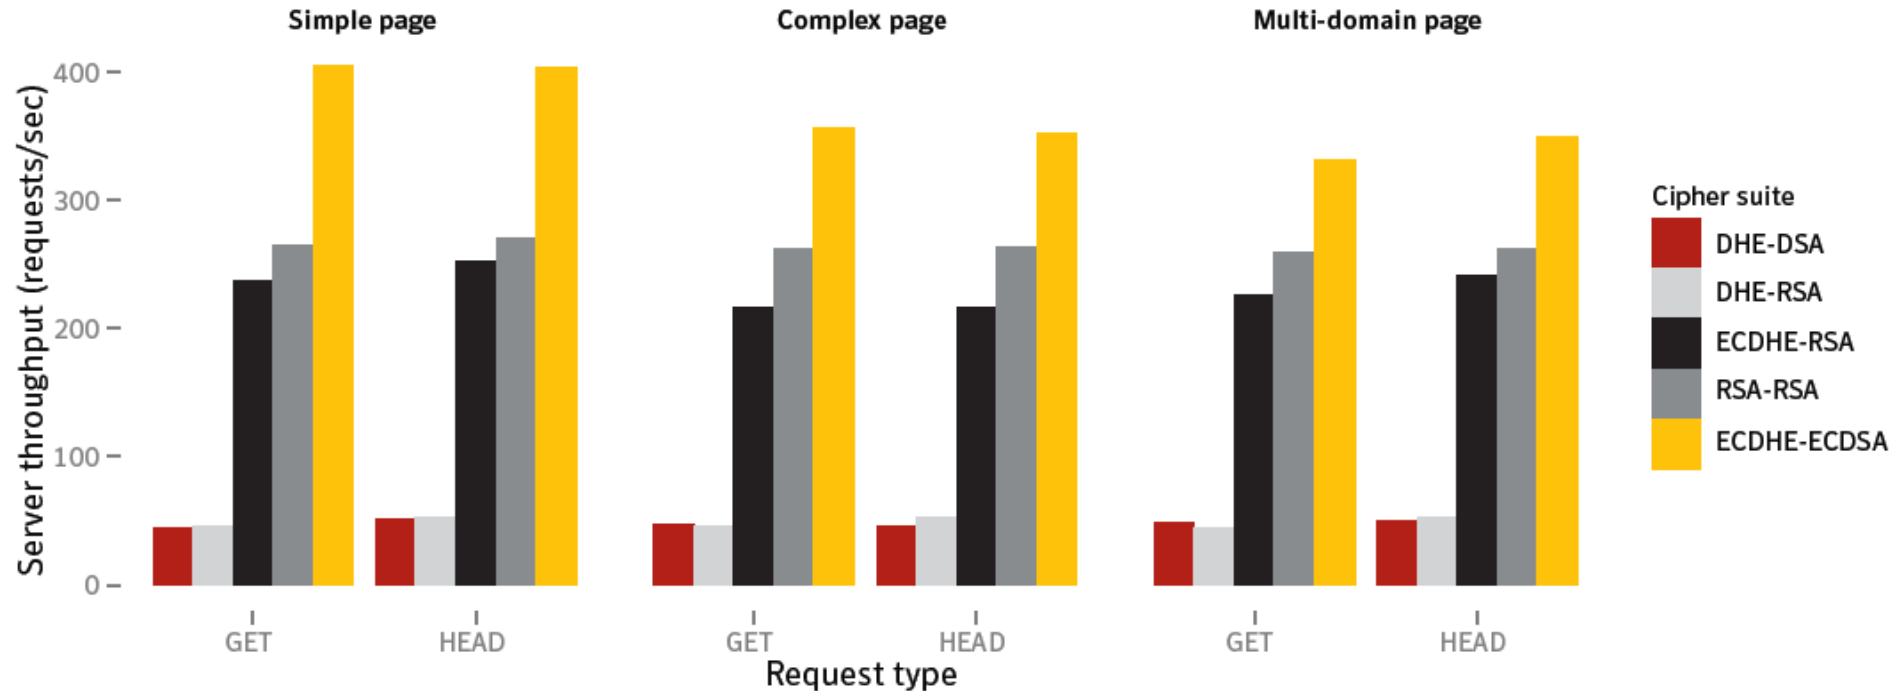

- Large SSL deployments w/out additional hardware
- Securing the enterprise:
  - Use fewer resources
  - Lower costs

4

## Future of Crypto Tech

- Viable for many years
- Built for Internet of Things
- Supports billions of new devices coming online
- Ideal for Open Networks
- Truly "future proof" trust infrastructure in place

# RSA Encryption & Decryption Exercise

- Choose a number  $1 < x < 33$
- Encrypt  $x$  with RSA using the public key  $n=33, e=13$
- Decrypt the encrypted number using the private key  $n=33, d=17$
- Check if the decrypted number equals the original number

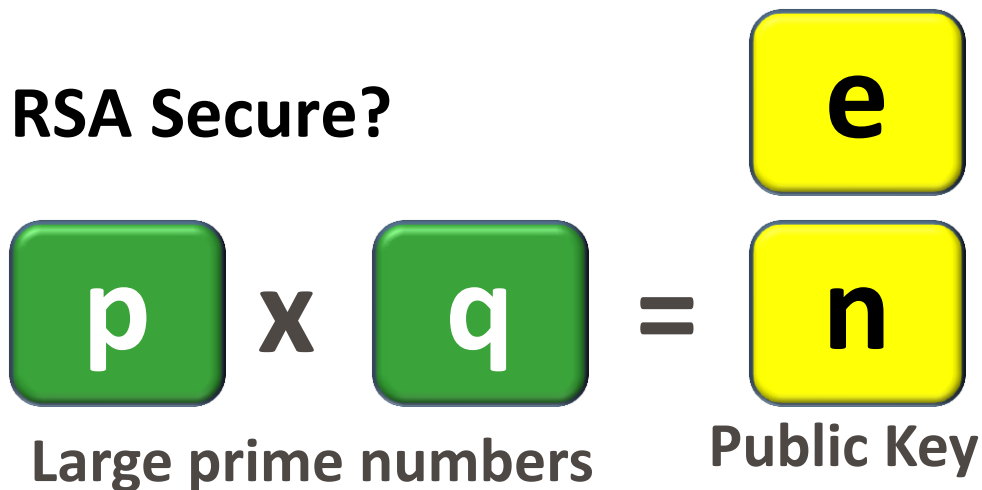

|                   |                          |
|-------------------|--------------------------|
| <b>Encryption</b> | $y = x^e \text{ mod } n$ |
| <b>Decryption</b> | $x = y^d \text{ mod } n$ |

## Modular Arithmetic (MOD Operation)

Modular arithmetic is related to that of the remainder in division. The operation of finding the remainder is sometimes referred to as the modulo operation, for example  $14 \text{ (mod } 12) = 2$ .

# Why is RSA Secure?

## Diffie-Hellman key agreement

- Using **Diffie-Hellman** key agreement, client and server agree a session key without ever sending the key across the network

**Diffie-Hellman can be used to enable Forward Secrecy**

# Diffie-Hellman Key Exchange Algorithm Example

## Formula

$$y = g^x \text{ mod } n$$

## Public Parameters

Prime modulus:  $n=31$

Primitive element:  $g=3$

Random value  $a=8$

$$\begin{aligned} A &= g^a \text{ mod } n \\ &= 3^8 \text{ mod } 31 \\ &= 20 \end{aligned}$$

$B=16$

$$\begin{aligned} S &= B^a \text{ mod } n \\ &= 16^8 \text{ mod } 31 \\ &= 4 \end{aligned}$$

Random value  $b=6$

$$\begin{aligned} B &= g^b \text{ mod } n \\ &= 3^6 \text{ mod } 31 \\ &= 16 \end{aligned}$$

$A=20$

$$\begin{aligned} S &= A^b \text{ mod } n \\ &= 20^6 \text{ mod } 31 \\ &= 4 \end{aligned}$$

Shared Secret  
Key (S) is  
the same

$$g^{ab} \text{ mod } n = g^{ba} \text{ mod } n$$

# Diffie-Hellman Key Exchange Exercise

- Choose a number  $1 < x < 20$
- Encrypt  $x$  with Diffie-Hellman using the public parameters  $n=31, g=3$
- Exchange the encrypted number  $y$  with your neighbour
- Calculate the shared key ( $S$ ) using your neighbour's encrypted number ( $y$ ) and your number ( $x$ )
- Check with your neighbour if your values for  $S$  are the same

|                   |                          |
|-------------------|--------------------------|
| <b>Encryption</b> | $y = g^x \text{ mod } n$ |
| <b>Shared Key</b> | $S = y^x \text{ mod } n$ |

## Modular Arithmetic (MOD Operation)

Modular arithmetic is related to that of the remainder in division. The operation of finding the remainder is sometimes referred to as the modulo operation, for example  $14 \text{ (mod } 12) = 2$ .

# TLS 1.2 Key Exchange Mechanisms

Forward  
Secrecy

# Elliptic Curves

An *elliptic curve* is a plane curve defined by an equation of the form:

$$y^2 = x^3 + ax + b$$

Examples:

# Elliptic Curve Cryptography (ECC)

- Adding 2 points on a curve produces another point on the curve
- Adding a point to itself produces another point on the curve
- If we add a point  $P$  to itself  $d$  times we end up with  $Q$ , another point on the curve

# Elliptic Curve Cryptography (ECC)

- Elliptic curves can be used to construct a public key cryptography system
- The private key  $d$  is randomly selected from  $[1, n-1]$ , where  $n$  is integer
- Then the public key  $Q$  is computed by  $dP$ , where  $P, Q$  are points on the elliptic curve
- Like the conventional cryptosystems, once the key pair  $(d, Q)$  is generated, a variety of cryptosystems such as signature, encryption/decryption and key management can be set up

# Recommended Key Sizes

| <b>Symmetric Key Size<br/>(bits)</b> | <b>RSA and Diffie-<br/>Hellman Key Size<br/>(bits)</b> | <b>Elliptic Curve Key<br/>Size (bits)</b> |
|--------------------------------------|--|---|
| <b>80</b>                            | <b>1024</b>  | <b>160</b>                                |
| <b>112</b>                           | <b>2048</b>  | <b>224</b>                                |
| <b>128</b>                           | <b>3072</b>  | <b>256</b>                                |
| <b>192</b>                           | <b>7680</b>  | <b>384</b>                                |
| <b>256</b>                           | <b>15360</b>   | <b>521</b>                                |

[http://www.nsa.gov/business/programs/elliptic\\_curve.shtml](http://www.nsa.gov/business/programs/elliptic_curve.shtml)

## Elliptic Curve Diffie-Hellman Example

- Alice and Bob make a key agreement over the following prime, curve, and point:

$$p=3851, E:y^2=x^3+324x+1287, \\ P=(920,303)\in E(\mathbb{F}_{3851})$$

- Alice chooses the private key  $d_A=1194$ , computes  $Q_A=1194P=(2067,2178)\in E(\mathbb{F}_{3851})$ , and sends it to Bob
- Bob chooses the private key  $d_B=1759$ , computes  $Q_B=1759P=(3684,3125)\in E(\mathbb{F}_{3851})$ , and sends it to Alice
- Alice computes  $d_A Q_B=1194(3684,3125)=(3347,1242)\in E(\mathbb{F}_{3851})$
- Bob computes  $d_B Q_A=1759(2067,2178)=(3347,1242)\in E(\mathbb{F}_{3851})$

# ECC Key Exchange Mechanisms

## A Final Note....

*Public key cryptography was first discovered by American geeks. Right? Wrong.*

# Thank you!

## **YOUR FEEDBACK IS VALUABLE TO US!**

Please take a few minutes to fill out the short session survey available on the mobile app—the survey will be available shortly after the session ends. Watch for and complete the more extensive post-event survey that will arrive via email a few days after the conference.

To download the app, go to <https://vision2014.quickmobile.com> or search for Vision 2014 in the iTunes or Android stores.
