## Storage

**How data can be deduplicated into a 250 TB volume** such as MSDP or Data Domain or any other deduplicating device?  It depends deduplication rate and amount stored is sensitive to deduplication rate.

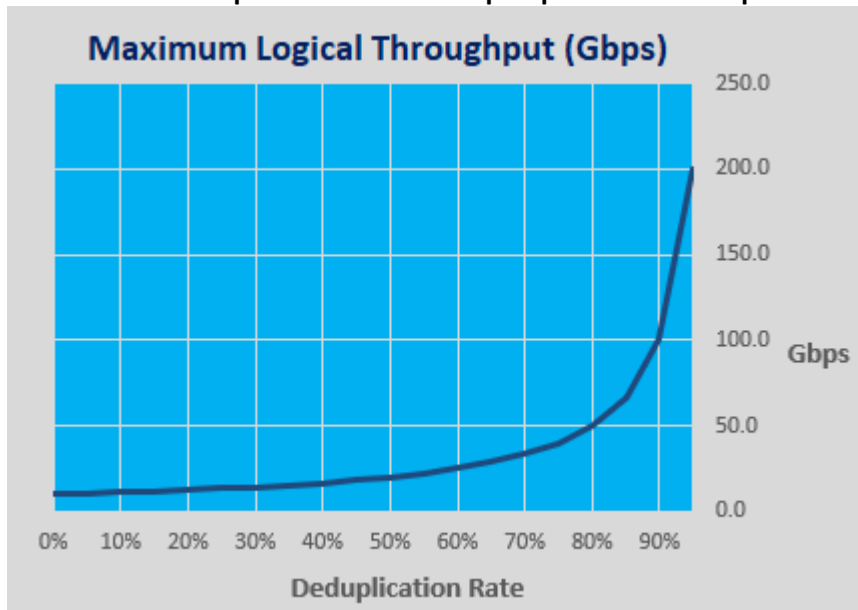

The chart displays TiB  - it will look the same for TB

## Transmission

(Ignoring the metadata overhead as it will vary)

**How fast can deduplicated data can be pumped into a 10 Gbps link**

**How much data can be pumped into a 10 Gbps link if its deduplicated first?**

Logical Data Transferred in 4 hours (TiB vs Deduplication Rate)

Time to logically transfer 4 TiB (Hours vs Deduplication Rate)
